Information on likely routes of exposure

In occupational settings, potassium permanganate is mostly absorbed by inhalation of dusts or aerosols of the solution. Water-soluble manganese compounds are well absorbed in the lungs if alveolar particles are inhaled. In addition, manganese ions absorbed in the nose can directly reach the brain via the olfactory nerve. Substance-specific quantitative data on are not available. [GESTIS]

Additional toxicological information:	
CAS: 7722-64-7 potassium permanganate	
<p>(source: GESTIS) Main toxic effects: Acute: caustic effect on skin and mucous membranes, risk of serious damage to eyes chronic: in animal experiments, changes in clinical-chemical and blood counts (as a result of liver and kidney damage), indications of neurotoxic effects general systemic effects of manganese ions: damage to the central nervous system</p> <p>Further information: In the event of contact with the crystalline substance or concentrated solution, there is a risk of severe chemical burns and possibly irreversible eye damage. Even very diluted solutions of K. can cause violet to black discoloration of the eyes, which is reversible after a few days. Areas of skin that have come into contact with K. are discolored brown due to the formation of poorly soluble manganese(IV) oxide.</p>
